# GL-S10 二次开发指南 V1.0 -- GL-iNet

版本	更改项	作者	日期
1.0	第一版	何丰	2020.04.15

### 1. 搭建开发环境

GL-S10主模块采用乐鑫的ESP32-WROOM-32U,开发环境可基于window、linux和macOS。用户可按自己的编程喜好选择基于 C 语音的 ESP-IDF 平台(乐鑫官方开源 SDK)、 AWS freeRTOS 平台(AWS 官方开源 SDK)或者基于 C++的 arduino IDE 平台(乐鑫官方提供组件)。

请按照您选择的开发平台搭建环境:

ESP-IDF: <a href="https://docs.espressif.com/projects/esp-idf/en/v3.3/get-started-cmake/index.html">https://docs.espressif.com/projects/esp-idf/en/v3.3/get-started-cmake/index.html</a>
AWS

freeRTOS: <a href="https://docs.aws.amazon.com/freertos/latest/userguide/getting\_started\_espressif.ht">https://docs.aws.amazon.com/freertos/latest/userguide/getting\_started\_espressif.ht</a> ml

Arduino IDE: <a href="https://github.com/espressif/arduino-esp32">https://github.com/espressif/arduino-esp32</a>

注:本指南以下内容皆以 ESP-IDF (linux) 为开发环境编写,部分步骤在其他平台不能通用。

## 2. 样例源码下载及编译

样例源码仓库: https://github.com/gl-inet/s10

### 编译步骤:

注:编译样例前请先确认您的开发环境(ESP-IDF)是否已搭建成功。

1. 样例源码下载:

mkdir esp32

cd esp32

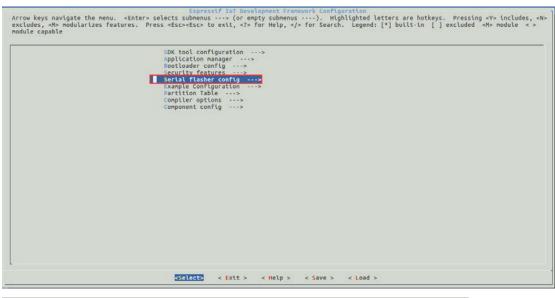

git clone

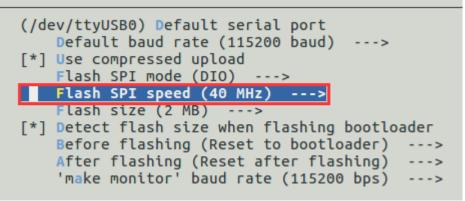

cd demo/esp32

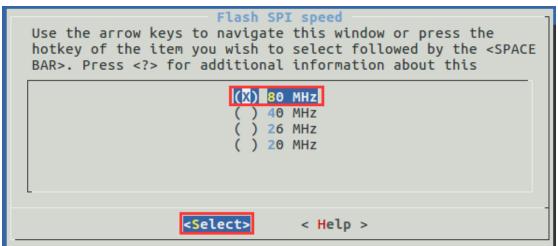

2. 配置:

make menuconfig

(1) 修改 flash SPI speed 为 80MHz 和 flash size 为 4MB

```
(/dev/ttyUSB0) Default serial port
    Default baud rate (115200 baud) --->
[*] Use compressed upload
    Flash SPI mode (DIO) --->
    Flash SPI speed (80 MHz) --->

[*] Detect flash size when flashing bootloader
    Before flashing (Reset to bootloader) --->
    After flashing (Reset after flashing) --->
    'make monitor' baud rate (115200 bps) --->
```

```
Use the arrow keys to navigate this window or press the hotkey of the item you wish to select followed by the <SPACE BAR>. Press <?> for additional information about this

( ) 1 MB
( ) 2 MB
( X) 4 MB
( ) 8 MB
( ) 16 MB

<Select> < Help >
```

(2) 修改 partition table (分区表)

```
SDK tool configuration --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Example Configuration --->
Partition Table --->
Compiler options --->
Component config --->
```

```
Partition Table (Single factory app, no OTA) --->
(0x8000) Offset of partition table
[*] Generate an MD5 checksum for the partition table
```

```
Use the arrow keys to navigate this window or press the hotkey of the item you wish to select followed by the <SPACE BAR>. Press <?> for additional information about this

( ) Single factory app, no OTA
( ) Factory app, two OTA definitions

(X) Custom partition table CSV
```

#### (3) 配置网口

```
SDK tool configuration --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Example Configuration --->
Partition Table --->
Compiler options --->
Component config --->
```

### 修改成如下图所示:

```
Ethernet PHY Device (LAN8720) --->
(1) Ethernet PHY Address
Ethernet PHY Clock Mode (GPI017 Output (inverted)) --->
[ ] Use PHY Power (enable / disable) pin
(23) SMI MDC Pin Number
(18) SMI MDIO Pin Number
```

### 3. 编译:

make all -j4

初次编译用时会较长,当打印如下信息时即为编译完成。

```
AR build/bt/libbt.a .sections_info

Generating libbt.a .sections_info

Generating sep32_project.ld

LD build/gj:sio.elf

espicol.pv v2.8-dev

for flash all buildwinespace/sep32/jDF/gsp-vid-v3.3/components/espicol.py/espicol.pv --chip esp32 --port /dev/ttyUSB0 --baud 115200 --before default_res

primar firm hard reset erite flash z --flash node dio --flash freq 80m --flash size detect 0xd000 /mnt/hgfs/workspace/esp32/project/esp32_ble_bridge/build/pia

data intital.bin 0xi0000 /mnt/hgfs/workspace/esp32/project/esp32_ble_bridge/build/pia

bridge/build/gl-sio.bin 0xx0000 /mnt/hgfs/workspace/esp32/project/esp32_ble_bridge/build/partitions.bin
```

# 3. 固件烧录、debug 调试

# 3.1 串口连接 GL-S10 与 PC

GL-S10 引出了两路 uart, uart0 用于烧录和 debug 打印; uart1 目前并未使用,留给客户按需接入外设。

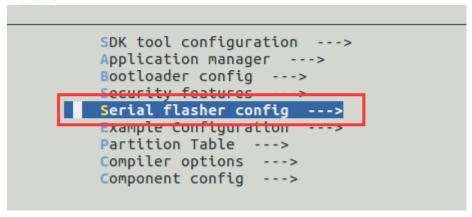

如图所示,uart0 从右往左分别是: TX/RX/GND。用户可使用 USB 转 uart 将 GL-S10 连接 到 PC 上。Uart0 默认的波特率为 115200,数据位 8,停止位 1,校验位 0。

## 3.2 固件烧录

开始烧录前,请先将 GL-S10 连接至 PC,按住图中所示的 BUTTON1,然后上电。请注意此时的 GL-S10 连接的是否是/dev/ttyUSB0。如果不是,请修改配置表中的串口默认配置,如下图所示

```
(//dev/ttyUSB0) Default serial port
    Default baud rate (115200 baud) --->
[*] Use compressed upload
    Flash SPI mode (DIO) --->
    Flash SPI speed (80 MHz) --->
    Flash size (4 MB) --->
[*] Detect flash size when flashing bootloader
    Before flashing (Reset to bootloader) --->
    After flashing (Reset after flashing) --->
    'make monitor' baud rate (115200 bps) --->
```

如果您使用 linux 的 esp-idf 环境,可以直接使用"make flash"指令烧录。当打印出如图所示的信息,表示当前已烧录完成。

```
Toolchain version: crosstool-ng-1.22.0-80-g6c4433a
Compiler version: 5.2.0
Python requirements from /mnt/hgfs/workspace/esp32/IDF/esp-idf-v3.3/requirements.txt are satisfied.

App "gl-s10" version: 1.10
Flashing binaries to serial port /dev/ttyUSB0 (app at offset 0x10000)...

```

如果您使用的是 window 的环境,并且从样例仓库的 release 目录下下载了固件,可以直接使用 flash 下载工具烧录固件(不需要 IDF 环境)。

Flash 工 具 下 载 地

址: https://www.espressif.com/sites/default/files/tools/flash\_download\_tools\_v3.6.8\_0.zip

### 3.3 debug 调试

debug 调试也是通过烧录的串口进行。在 GL-S10 烧录完成后,输入"make monitor"。 当打印出如图所示的信息后,将 GL-S10 重新上电,即可看到 debug 打印。

```
Toolchain version: crosstool-ng-1.22.0-80-g6c4433a
Compiler version: 5.2.0
Python requirements from /mnt/hgfs/workspace/esp32/IDF/esp-idf-v3.3/requirements.txt are satisfied.
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
```

## 4. OTA 升级固件

出厂的 GL-S10 固件都带有 OTA 升级的功能。如果您不希望通过拆壳连接串口烧录,也可以使用 OTA 更换固件。

GL-S10 的 OTA 是通过 http 访问服务器获取固件,相关操作步骤见 GL-S10 BLE-Gateway User Guide
